

Case Study introducing the CeilBlock CBC110 suspended ceiling coating process.

Client: Eason. Location: Dublin

Problem:

Faded suspended ceiling tiles. Light levels low.

Action:

RK Coatings trained crew covered all fixtures, fittings and stock before cleaning the ceiling and applying 2 coats of white CeilBlock CBC110 by means of an airless spray process, during off peak hours.

Result:

The coated ceiling shows a dramatic difference with the grids, speaker and air vent also coated giving the client a clean, bright working environment.

Savings:

The client saved 65% compared to replacement costs with a guarantee that the ceiling will retain its new look for as long as a newly fitted ceiling would.

Benefits:

There are many benefits to be gained by having your ceiling tiles sprayed rather than replacing them...

- There will be absolutely no disruption to your business as all work is carried out during your off peak hours.
- The suspended ceiling coating is carried out in a fraction of the time that it would take to replace the ceiling tiles.
- It only costs a fraction of the replacement costs to spray suspended ceilings in your choice of colour.
- There is no need to employ additional contractors such as ceiling installation contractors, electricians, fire alarm engineers, c.c.t.v. engineers etc.
- The spraying process will NOT cause the tiles to stick to the grids.
- Alarms, emergency lighting systems and cameras do not need to be decommissioned while we carry out the suspended ceiling coating.
- We GUARANTEE that the suspended ceiling will retain its new look for as long as newly fitted ceiling tiles would.
- The original ceiling tiles are retained and not disposed of as landfill.
- There will be absolutely no disruption whatsoever to your business...Guaranteed!
